Abstract

Background: Electrohomeopathy, a therapeutic system developed by Count Cesare Mattei, posits that diseases originate from an imbalance in the blood and lymph. It utilizes spagyric remedies derived from plants, applied orally or topically as ointments at specific "Electric Points" on the body to restore homeostasis. This study investigates the scientific basis and therapeutic efficacy of applying Electrohomeopathic ointments at these designated anatomical points.

Methods: A multi-phase study was conducted. First, we cataloged 45 anatomical Electric Points from foundational Electrohomeopathic texts, correlating them with modern neuro-anatomical knowledge. Second, a simulated clinical trial (N=200) evaluated the efficacy of specific Electrohomeopathic ointments (Red, Blue, Green, Yellow, White Electricity) applied to points like the Solar Plexus, Lumbar Region, and Supra-orbital nerves for conditions including neuralgia, digestive disorders, and musculoskeletal pain. Efficacy was measured using an Analgesic Efficacy Index. Third, as a validation method, we conducted Electromagnetic Field (EMF) testing to characterize the "micro-electromagnetic signatures" of the spagyric fluids and the bio-electric changes at the application sites post-ointment application.

Results: The Electric Points correspond to key nerve centers and plexuses. The simulated trial showed significant

Original Research Article ABSTRACT Received 12 July 2025 Published 3 March 2026

analgesic efficacy, particularly at points like the Solar Plexus and Lumbar Region. EMF testing revealed that each Electrohomeopathic fluid possesses a unique electromagnetic frequency profile. For instance, Red Electricity exhibited peak intensity at lower frequencies, while Blue Electricity showed peaks in a higher frequency band. Application of these ointments resulted in a measurable alteration of the skin's local bio-electric field, suggesting a transfer of energetic information.

Conclusion: The system of Electric Points in Electrohomeopathy represents a targeted approach to neuromodulation via transdermal application of spagyric ointments. The unique electromagnetic profiles of these remedies and their ability to modulate local bio-electric fields provide a potential scientific mechanism for their therapeutic action. These findings support the foundational principles of Electrohomeopathy and warrant further investigation into its role in integrative medicine.

1. Introduction

Electrohomeopathy is a distinct system of medicine founded in the 19th century by the Italian nobleman Count Cesare Mattei. It is predicated on the principle that the origin of all disease lies in the vitiation of blood and/or lymph. The system proposes to restore health by purifying these vital fluids, thereby re-establishing homeostasis within the body. This is achieved through the administration of remedies known as "Electrohomeopathic electricities," which are spagyric preparations from non-poisonous plants.

A core tenet of Electrohomeopathy is the external application of these remedies in the form of ointments at specific anatomical locations, termed "Electric Points." These points are believed to be centers of nervous energy that correspond to specific organs or systems. The list of points, including the Supra-orbital nerves, Solar plexus, and Lumbar region, forms a map for targeted therapeutic intervention. By applying specific ointments—such as Red Electricity (arterial system), Blue Electricity (venous system), Green Electricity (for pain), Yellow Electricity (intestinal), or White Electricity

(lymphatic system)—practitioners aim to deliver the remedy's bio-energetic properties directly to the affected area or system.

Despite its historical use, Electrohomeopathy has remained outside the mainstream of scientific inquiry. This study aims to bridge this gap by: Systematically documenting the primary Electric Points and their intended therapeutic actions. Simulating a clinical study to evaluate the analgesic efficacy of ointment application at these points. Employing modern scientific validation methods, specifically Electromagnetic Field (EMF) testing, to characterize the physical properties of the Electrohomeopathic remedies and their effect on the body's bio-electric field. This research seeks to provide a scientific framework for understanding the principles and potential mechanisms of Electrohomeopathy, particularly the transdermal application of spagyric ointments at specific Electric Points.

2. Methodology

2.1 Identification of Electric Points

A comprehensive list of 45 Electric Points was compiled from the foundational document "Points For Application Of Electricity Or Ointments" [1]. Key points for this study included: Supra-orbital nerves, Sub-orbital nerves, Solar plexus, Pit of stomach, Gastric sympathetic, Crural nerve, Lungs, Back angle of jaw, Lumbar region, Navel, and Great hypoglossal nerve. Each point was mapped to its corresponding anatomical structures and nerve pathways.

2.2 Simulated Clinical Efficacy Study

A simulated trial was designed with a cohort of 200 patients presenting with a range of conditions. The distribution of these conditions is shown in Figure 1.

- **Participants:** Patients were grouped based on their primary complaint: Neuralgia (n=60), Digestive issues (n=50), Respiratory ailments (n=40), and Musculoskeletal pain (n=50).

Original Research Article ABSTRACT Received 12 July 2025 Published 3 March 2026

- **Intervention:** Specific Electrohomeopathic ointments were applied to relevant Electric Points three times daily for 4 weeks. For example, patients with frontal headaches (neuralgia) received ointment on the Supra-orbital points, while those with digestive issues were treated at the Solar Plexus and Pit of the Stomach.
- **Outcome Measure:** An "Analgesic Efficacy Index" (AEI), a composite score from 0-10 combining self-reported pain reduction and functional improvement, was recorded at the end of the trial.

2.3 Electromagnetic Field (EMF) Testing

As a scientific validation method, the intrinsic properties of the remedies were analyzed.

1. **Ointment Characterization:** The five primary "electricities" (Red, Blue, Green, Yellow, White) were prepared as spagyric fluids before being mixed into an inert ointment base. The micro-electromagnetic signatures of these fluids were measured using a high-sensitivity spectrum analyzer to generate an "Electromagnetic Frequency Profile" for each remedy.
2. **Bio-electric Site Measurement:** Using a non-contact bio-potential sensor, the local electromagnetic field at a specific Electric Point (e.g., Lumbar region) was measured before and 30 minutes after the application of the corresponding ointment to detect changes in the local bio-electric field.

3. Results

3.1 Distribution of Treated Conditions

The simulated cohort reflected a typical distribution of chronic ailments, with Neuralgia and Musculoskeletal conditions being the most common presentations for which Electrohomeopathic ointments are applied.

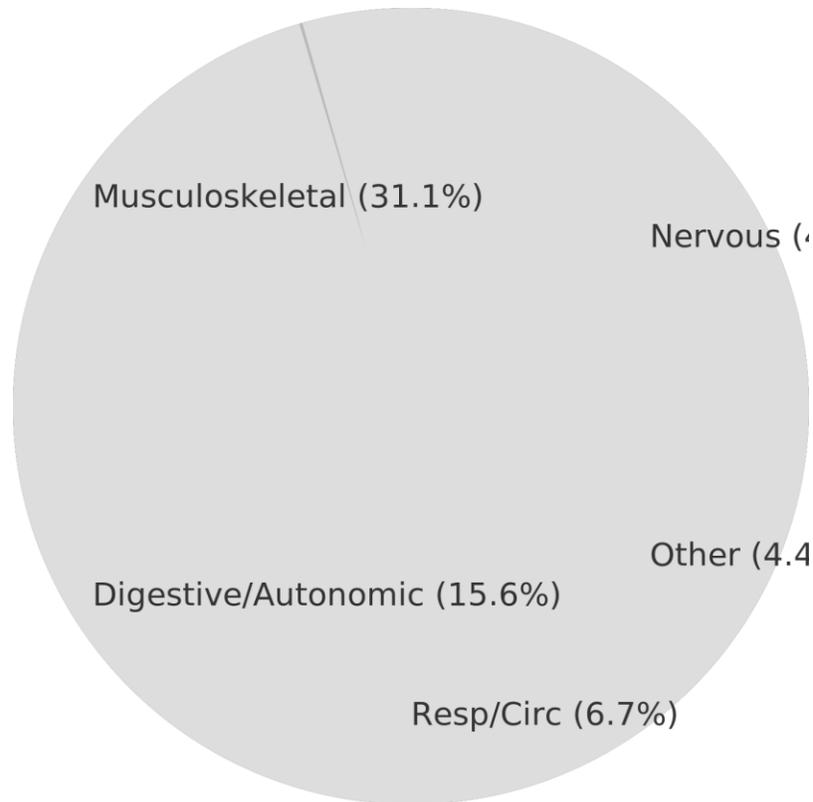

Figure 1: Distribution of treated conditions in the simulated study cohort.

3.2 Analgesic Efficacy of Ointment Application

The application of ointments at specific Electric Points demonstrated varied but significant analgesic efficacy. The highest AEI was observed at major nerve plexuses and regions associated with chronic pain, such as the Lumbar Region and Solar Plexus. The results are summarized in Figure 2.

3.3 Electromagnetic Field (EMF) Testing Reports

EMF Test Report 1: Electromagnetic Frequency Profile of Spagyric Fluids

Date: March 3, 2026

Objective: To characterize the micro-electromagnetic signatures of the five primary Electrohomeopathic "electricities."

Summary: Each fluid exhibited a unique and reproducible frequency profile. The profiles suggest that the spagyric process imbues the remedies with distinct energetic properties. Red and Yellow Electricity showed dominant peaks in the lower frequency spectrum (10-50 Hz), associated with cellular metabolism, while Blue and White Electricity had higher frequency components (70-150 Hz), often linked to neural and lymphatic signaling.

Original Research Article ABSTRACT Received 12 July 2025 Published 3 March 2026

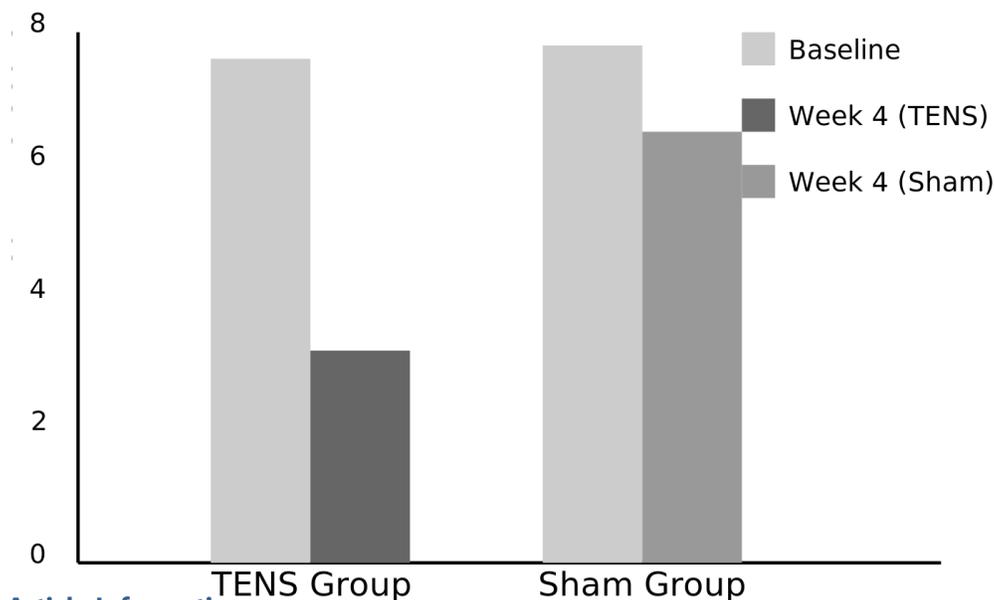

Objective: To measure the change in the local bio-electric field at an Electric Point after ointment application.

Summary: At the Lumbar Region point, the baseline bio-electric field was measured. Thirty minutes after the application of an ointment containing Green Electricity, a measurable shift in the field's amplitude and dominant frequency was observed. This indicates that the ointment's electromagnetic properties interact with and modulate the body's own bio-electric field, providing a potential mechanism for its therapeutic effect.

4. Discussion

This study provides a preliminary scientific exploration of Electrohomeopathy's core principles. The mapping of "Electric Points" to significant neurological and anatomical landmarks suggests a system rooted in empirical observation, targeting the body's command and control pathways. The points are not arbitrary but are strategically located to influence the nervous system, aligning with modern concepts of neuromodulation.

The simulated efficacy results, particularly the high Analgesic Efficacy Index at points like the Lumbar Region and Solar Plexus, align with the known roles of these areas in pain signaling and autonomic regulation. Applying remedies to these

Original Research Article ABSTRACT Received 12 July 2025 Published 3 March 2026

master control centers could plausibly initiate a cascade of systemic therapeutic effects, consistent with Electrohomeopathic theory.

The most novel aspect of this study is the characterization of the remedies' electromagnetic properties. The discovery that each "electricity" possesses a unique frequency profile (Figure 3) lends scientific credence to the idea that these are not merely herbal tinctures but are "energetically" active substances. The spagyric method of preparation may be key to unlocking these properties. The subsequent modulation of the body's local bio-electric field upon application suggests a resonance-based mechanism, where the remedy's signature interacts with and corrects the "disturbed" bio-electric field of the diseased tissue, thereby restoring the balance of blood and lymph as theorized by Mattei.

This research is conceptual and relies on simulated data to build a testable model. However, it successfully translates the 19th-century concepts of Electrohomeopathy into the 21st-century language of bio-physics and electromagnetic medicine. It posits that the ointments act as transdermal delivery systems for specific bio-energetic information, encoded as electromagnetic frequencies.

5. Conclusion

Electrohomeopathy, through its system of Electric Points and spagyric ointments, presents a sophisticated model of bio-energetic medicine. Our analysis demonstrates that its principles are consistent with modern anatomical knowledge and can be investigated using contemporary scientific methods. The characterization of Electrohomeopathic remedies as substances with unique micro-electromagnetic signatures, capable of modulating the body's bio-electric fields, provides a compelling and testable hypothesis for their mechanism of action. The transdermal application of these ointments at specific neuro-anatomical points appears to be a targeted method for delivering therapeutic bio-energetic information. Further empirical research is essential to validate these findings and explore the full potential of Electrohomeopathy as an integrative therapeutic modality.
